

# Data Analysis

# Success Hacks

- Be prepared for the class by watching the pre class videos
- Attend every class; **Sunday and Thursday**
- Participate in class
- Attempt all the MCQs
- Actively advocate for yourself
- Keep your goal in mind
- **Consistency is the key**

Be patient with yourself !

# IK

## Support Features

- **Uplevel** - contains all the learning resources - videos, MCQs, reading materials
- Optional **Post class videos** for additional reference
- **Technical coaching sessions** on Wednesday to clarify all your queries

**INTERVIEW  
KICKSTART**

# IK

## Support Features

- **Discord** community for peer learning
- **TAs** to help answer the queries in the live class
- Use **academic support (SSAs)** for any support/advice you want
- **Support tickets** - Raise them any time you want any clarifications/ tech concerns , etc

**INTERVIEW  
KICKSTART**

# Wednesday and Thursday Sessions

After the main class watch the **post class videos** – These are purely **OPTIONAL**

## Wednesday - Technical Coaching Session

One hour of topical review on the class. This is an excellent time to reinforce Sunday's content or ask advanced questions, depending on your experience.

## Thursday - Assignment Review Session

Two hours to review the MCQs. MCQs are designed to reinforce the learning objectives which tie directly to knowledge and skills you will need in industry and in interviewing.

# Watched the pre-class foundation videos for this session on **Data Analysis**?

Watch them before the class for better learning outcomes!

*Note: The pre-class materials might be videos or reading material or a combination of both. This might vary as per the content of the module.*

*The live class materials also might vary as per the module - slides, coding demo or a combination of both.*

# Machine Learning Pipeline

# What is a 'dataset'?

- A dataset is a collection of values, usually either numbers (quantitative) or strings (qualitative).
- Datasets can include various types of data, such as numbers, text, images, or audio recordings, all stored together for easy access and analysis.
- Datasets are essential in data analytics & ML to identify patterns, draw insights, and train ML models.

Columns

# Shall we use the dataset as such without cleaning?

No!

Raw datasets often contain errors, missing values, duplicates, or inconsistencies.

Using uncleaned data can lead to inaccurate results and unreliable models.

# How to clean the data?

# Missing Values Detection

Data Analysis &  
Visualization

# Steps involved in Data Analysis

## Univariate Analysis

**Focus:** One Variable at a time

**Goal:** To understand the distribution, central tendency (like mean or median), and spread (like range or standard deviation) of that single variable

- Summary Statistics
- Numerical Variables
  - Histogram
  - Violin Plot
  - Box Plot
- Categorical Variables
  - Count Plot
  - Bar Graph
  - Pie Chart

## Bivariate Analysis

**Focus:** Two Variables at a time

**Goal:** Examining the relationship between two variables to see how they influence each other.

- Numerical Variables
  - Scatter Plot
  - Joint Plot
- Categorical Variables
  - Count Plot
- Numerical vs Categorical
  - Bar Plot
  - Box Plot
  - Violin Plot
  - Displot

## Multivariate Analysis

**Focus:** More than Two Variables at a time

**Goal:** To understand the complex relationships between the variables

- Bar Plot
- Histogram
- Heat Map
- Pair Plot

# Let's take this example...

Let's consider the Titanic dataset which contains details about passengers such as age, gender, and ticket class. Using this, we analyze and find out factors that influenced survival during the tragic sinking.

# Univariate Analysis for Titanic Data

## UNIVARIATE ANALYSIS

**What was the age distribution of passengers on the Titanic?** - Examines how old the passengers were, from the youngest to the oldest.

**How many passengers were in each ticket class?** - Looks at the number of passengers who bought first-class, second-class, or third-class tickets.

# Bivariate Analysis for Titanic Data

## BIVARIATE ANALYSIS

**Did ticket class influence the chances of survival?** - Compares survival rates across different ticket classes to see if those in higher classes had better chances of survival.

**Was there a relationship between age and survival?** - Investigates whether younger or older passengers were more likely to survive.

# Multivariate Analysis for Titanic Data

## MULTIVARIATE ANALYSIS

**How did age, ticket class, and gender together influence survival rates?** - Analyzes the combined effect of age, ticket class, and gender on survival to identify more complex patterns.

**How did ticket price, class, and where passengers boarded collectively impact survival?** - Investigates the combined influence of the amount paid for the ticket, class, and boarding location on survival chances.

# Detecting Outliers

- An outlier is an observation that lies an abnormal distance from other values in a dataset.
- Outliers can be caused by data entry errors, experimental errors, or naturally occurring variations.
- Outliers can skew the results of statistical analyses, leading to misleading conclusions or poor model performance in machine learning.

# Detecting Outliers

# Handling Outliers

- **Remove Outliers:** If outliers are due to errors or irrelevant to the analysis, consider removing them from the dataset.
- **Cap or Floor Values:** Limit outliers by capping extreme values at a set maximum or minimum threshold.
- **Transform Data:** Apply transformations like logarithms or square roots to reduce the impact of outliers.
- **Analyze Separately:** Treat outliers as a separate group if they represent significant but rare events, analyzing them independently from the main dataset.

Analysed the  
data pretty  
well. Any scope  
of improving  
the data before  
modelling?

Feature  
Engineering

# Feature Engineering

# Feature Creation

- Feature creation involves generating new features (variables) from existing data to enhance the predictive power of machine learning models.
- **Techniques:**
  - Combining features (e.g., multiplying or adding two features)
  - Extracting components (e.g., year from a date)
  - Applying domain knowledge to create new features.
- **Examples:** For a dataset with date and time, shall create features like "Day of the Week" or "Hour of the Day" to capture time-related patterns.

# Feature Transformation

- Encoding is a feature transformation technique
- Feature encoding is necessary because most machine learning algorithms require numerical input to process data effectively

# Feature Extraction

- Feature extraction is the process of identifying and selecting the most important information or characteristics from a data set.
- **Techniques:**
  - Dimensionality reduction techniques like Principal Component Analysis (PCA), etc

# Feature Selection

- Feature selection involves choosing a subset of the most important features from the original dataset to improve model performance by eliminating irrelevant or redundant data.
- **Examples:** In a dataset with 100 features, feature selection might identify that only 20 features are strongly correlated with the target variable and should be used for model training.

# Exploratory Data Analysis

- All data processing, visualization & feature engineering techniques discussed so far is collectively referred to as EDA - Exploratory Data Analysis
- Exploratory Data Analysis (EDA) is an umbrella term that encompasses a variety of techniques and processes aimed at understanding and preparing data before modeling.

# Summary

01

Data preprocessing includes cleaning, transforming, encoding, and preparing data, which lays the foundation for accurate and effective ML models.

02

Data Cleaning: Essential for ensuring the accuracy and reliability of your dataset by handling missing values, correcting errors, and removing duplicates.

03

EDA: Involves visualizing and summarizing the data to uncover patterns, relationships, and anomalies before modeling.

04

Identifying and addressing outliers is crucial to avoid skewing your analysis and improving model performance.

05

One-Hot Encoding: Transforms categorical variables into binary columns, allowing machine learning models to process them effectively.

Attend the **Thursday sessions** for more practise!

Get your queries clarified via **Wednesday sessions!**

# Upcoming Class: **Intro to Machine Learning**

*Note: You will get a brief idea of Supervised Machine Learning - Regression , Classification.*

*Algorithms Covered: Linear Regression, Logistic Regression*

# Watch the pre-class foundation videos before coming to the next class!

Watch them before the class for better learning outcomes!

*Note: The pre-class materials might be videos or reading material or a combination of both. This might vary as per the content of the module.*

*The live class materials also might vary as per the module - slides, coding demo or a combination of both.*
